

Dimensionality Reduction

Principal Components Analysis

Based on slides by Barnabás Póczos, UAlberta

How Can We Visualize High Dimensional Data?

• E.g., 53 blood and urine tests for 65 patients

	H-WBC	H-RBC	H-Hgb	H-Hct	H-MCV	H-MCH	H-MCHC
A1	8.0000	4.8200	14.1000	41.0000	85.0000	29.0000	34.0000

Features

Difficult to see the correlations between the features...

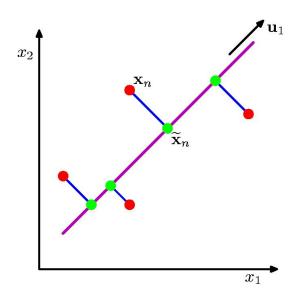

Data Visualization

- Is there a representation better than the raw features?
 - Is it really necessary to show all the 53 dimensions?
 - ... what if there are strong correlations between the features?

Could we find the *smallest* subspace of the 53-D space that keeps the *most information* about the original data?

One solution: Principal Component Analysis

Principle Component Analysis

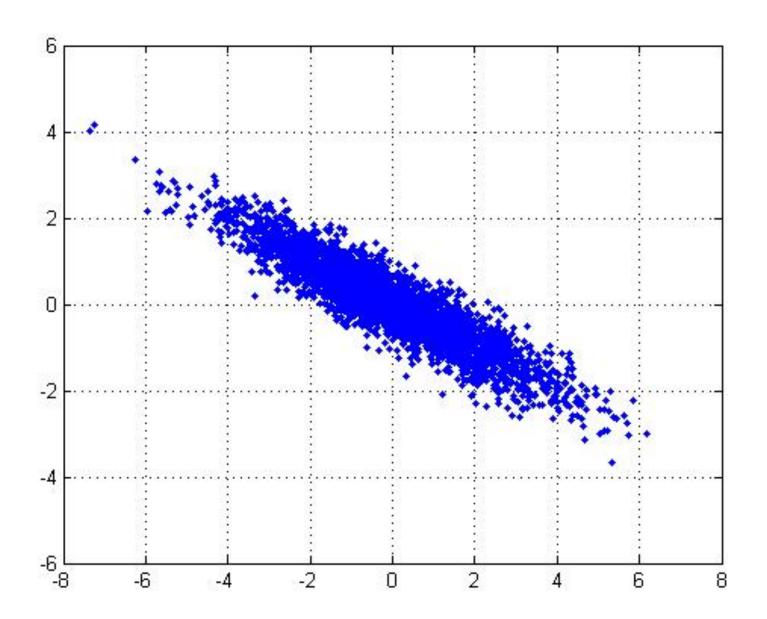

Orthogonal projection of data onto lower-dimension linear space that...

- maximizes variance of projected data (purple line)
- minimizes mean squared distance between data point and projections (sum of blue lines)

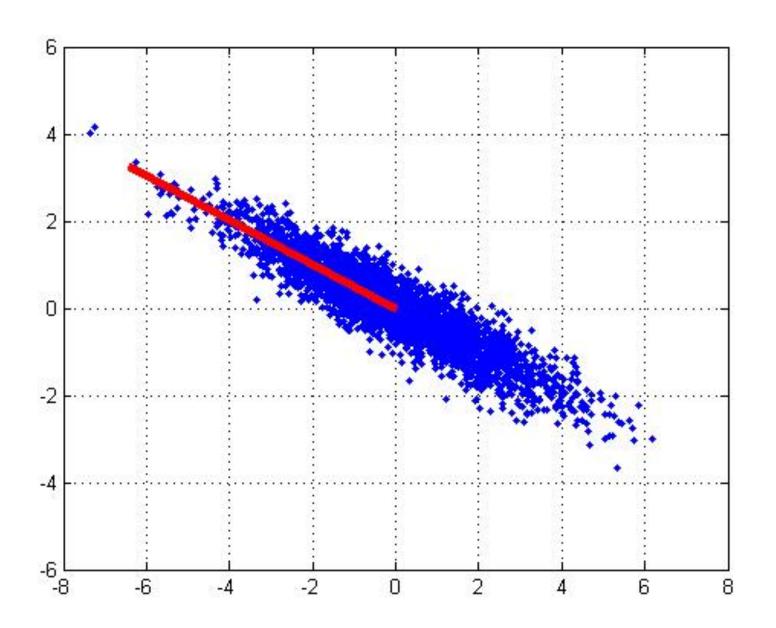

The Principal Components

- Vectors originating from the center of mass
- Principal component #1 points in the direction of the largest variance
- Each subsequent principal component...
 - is orthogonal to the previous ones, and
 - points in the directions of the largest variance of the residual subspace

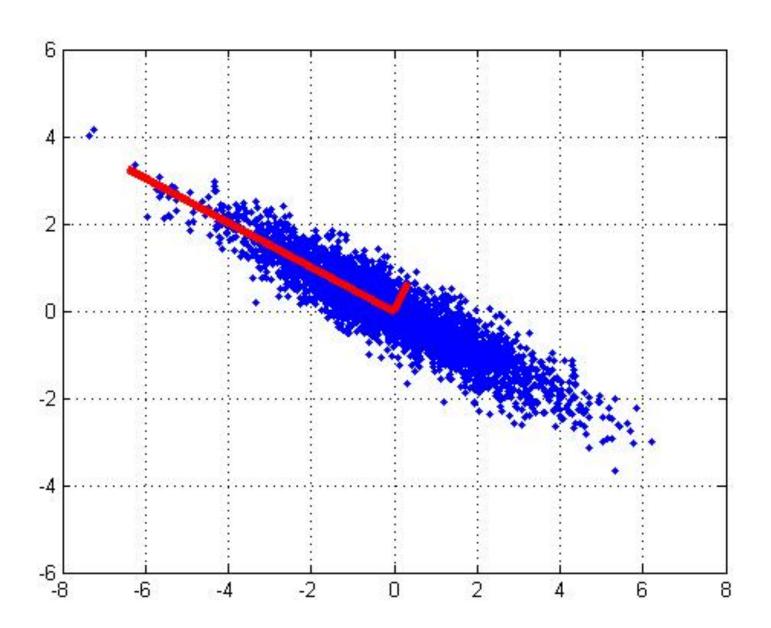

2D Gaussian Dataset

1st PCA axis

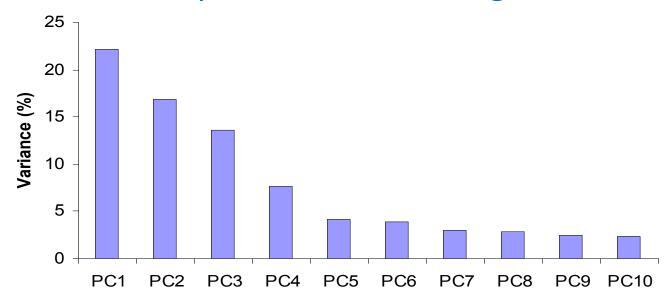

2nd PCA axis

Dimensionality Reduction

Can *ignore* the components of lesser significance

You do lose some information, but if the eigenvalues are small, you don't lose much

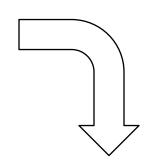

- choose only the first k eigenvectors, based on their eigenvalues
- final data set has only k dimensions

PCA Algorithm

- Given data $\{\mathbf{x}_1, ..., \mathbf{x}_n\}$, compute covariance matrix $\mathbf{\Sigma}$
 - X is the n x d data matrix
 - Compute data mean (average over all rows of X)
 - ullet Subtract mean from each row of X (centering the data)
 - Compute covariance matrix $\Sigma = X^TX$ (Σ is $d \times d$)
- PCA basis vectors are given by the eigenvectors of Σ
 - ullet $\mathrm{Q},\!\Lambda=\mathsf{numpy}.\mathsf{linalg.eig}(\Sigma)$
 - $\{\mathbf{q}_i, \lambda_i\}_{i=1..n}$ are the eigenvectors/eigenvalues of Σ ... $\lambda_1 \ge \lambda_2 \ge ... \ge \lambda_n$
- Larger eigenvalue ⇒ more important eigenvectors

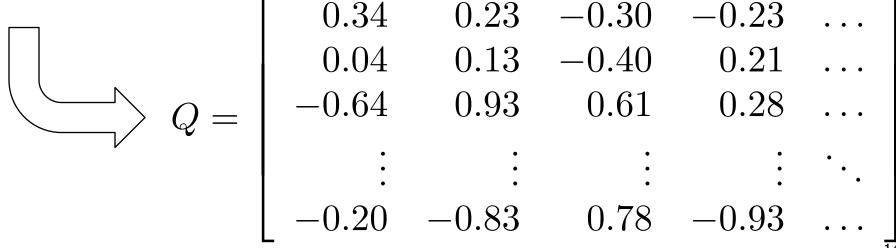

$$X = \begin{bmatrix} 0 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & \dots \\ 1 & 1 & 0 & 1 & 1 & 1 & 0 & 0 & \dots \\ 0 & 0 & 1 & 1 & 1 & 0 & 0 & 0 & \dots \\ & & \vdots & & & & \vdots & & & \\ 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & \dots \end{bmatrix}$$

X has d columns

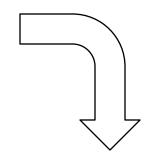

Q is the eigenvectors of Σ ; columns are ordered by importance!

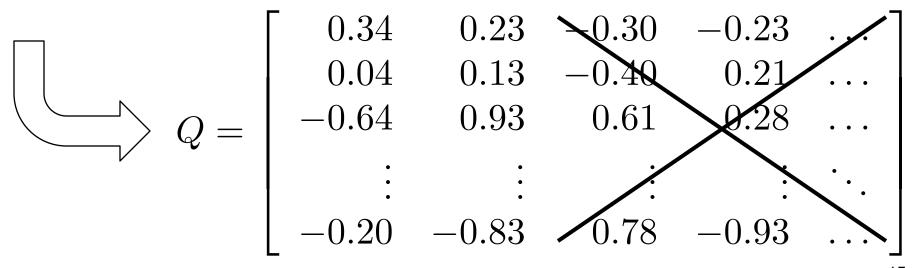

Q is $d \times d$

$$X = \begin{bmatrix} 0 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & \dots \\ 1 & 1 & 0 & 1 & 1 & 1 & 0 & 0 & \dots \\ 0 & 0 & 1 & 1 & 1 & 0 & 0 & 0 & \dots \\ & & & \vdots & & & & \vdots & & & \\ 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & \dots \end{bmatrix}$$

Each row of Q corresponds to a feature; keep only first k columns of Q

 Each column of Q gives weights for a linear combination of the original features

$$Q = \begin{bmatrix} 0.34 & 0.23 & 0.30 & -0.23 & 0.00 &$$

= 0.34 feature1 + 0.04 feature2 - 0.64 feature3 + ...

• We can apply these formulas to get the new representation for each instance ${\bf x}$

• The new 2D representation for x_3 is given by:

$$\hat{x}_{31} = 0.34(0) + 0.04(0) - 0.64(1) + \dots$$

 $\hat{x}_{32} = 0.23(0) + 0.13(0) + 0.93(1) + \dots$

ullet The re-projected data matrix is given by ${\stackrel{f \wedge}{
m X}}={
m X}{\stackrel{f \wedge}{
m Q}}$

PCA Example

	Data			Center Data		
	x	y		\boldsymbol{x}	y

PCA Visualization of MNIST Digits

Challenge: Facial Recognition

- Want to identify specific person, based on facial image
- Robust to glasses, lighting,...
 - → Can't just use the given 256 x 256 pixels

PCA applications - Eigenfaces

- Eigenfaces are
 the eigenvectors of
 the covariance matrix of
 the probability distribution of
 the vector space of
 human faces
- Eigenfaces are the 'standardized face ingredients' derived from the statistical analysis of many pictures of human faces
- A human face may be considered to be a combination of these standard faces

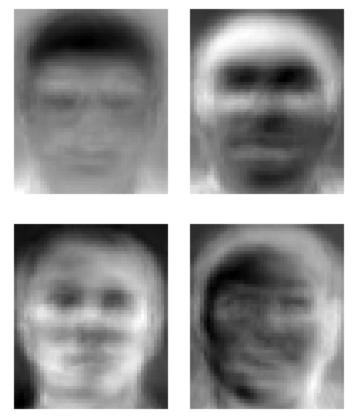

PCA applications - Eigenfaces

To generate a **set of eigenfaces**:

- Large set of digitized images of human faces is taken under the same lighting conditions.
- The images are normalized to line up the eyes and mouths.
- 3. The eigenvectors of the covariance matrix of the statistical distribution of face image vectors are then extracted.
- 4. These eigenvectors are called eigenfaces.

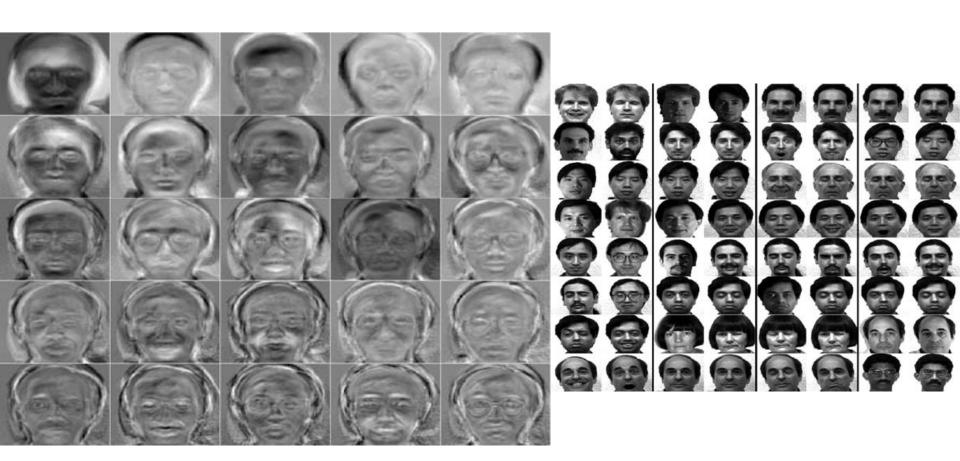

PCA applications - Eigenfaces

 the principal eigenface looks like a bland androgynous average human face

http://en.wikipedia.org/wiki/Image:Eigenfaces.png

Eigenfaces

Eigenfaces – Face Recognition

- When properly weighted, eigenfaces can be summed together to create an approximate grayscale rendering of a human face.
- Remarkably few eigenvector terms are needed to give a fair likeness of most people's faces
- Hence eigenfaces provide a means of applying <u>data compression</u> to faces for identification purposes.
- Similarly, Expert Object Recognition in Video

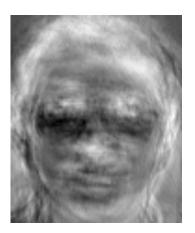

Eigenfaces

Experiment and Results

Data used here are from the ORL database of faces. Facial images of 16 persons each with 10 views are used. - Training set contains 16×7 images.

Test set contains 16×3 images.

First three eigenfaces:

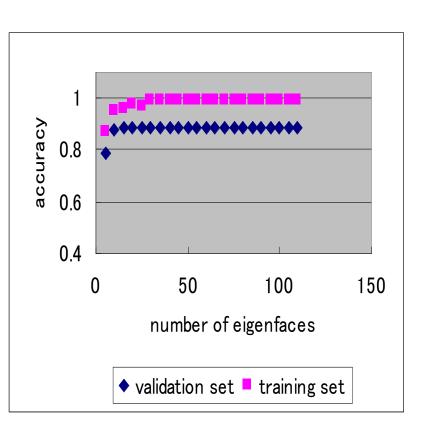

Classification Using Nearest Neighbor

- Save average coefficients for each person. Classify new face as the person with the closest average.
- Recognition accuracy increases with number of eigenfaces till 15.
 Later eigenfaces do not help much with recognition.

Best recognition rates

Training set 99%

Test set 89%

Facial Expression Recognition: Happiness subspace

Disgust subspace

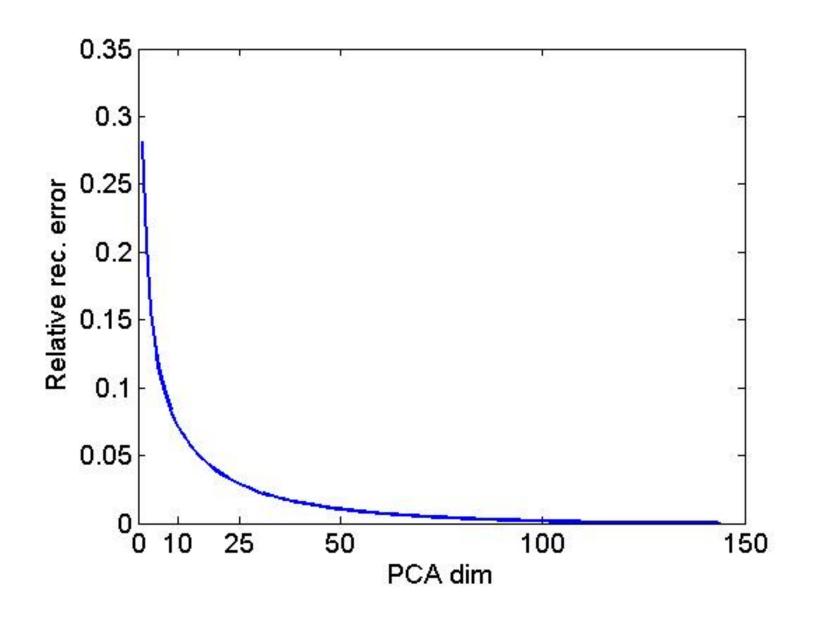

Image Compression

Original Image

- Divide the original 372x492 image into patches:
 - Each patch is an instance that contains 12x12 pixels on a grid
- View each as a 144-D vector

L₂ error and PCA dim

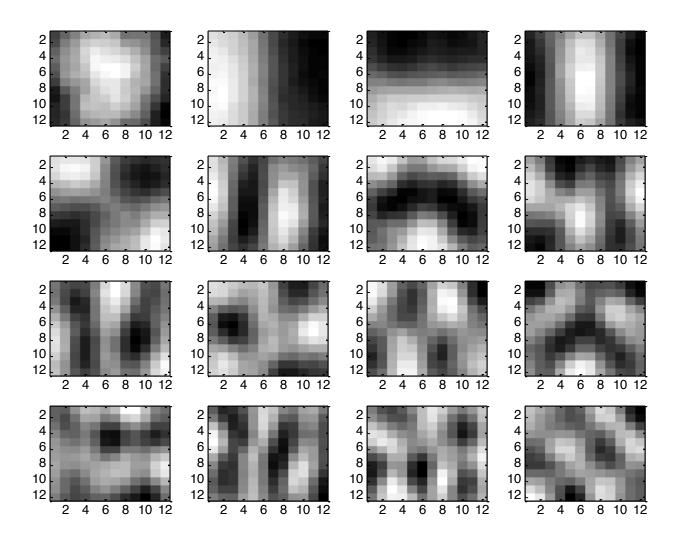

PCA compression: $144D \Rightarrow 60D$

PCA compression: $144D \Rightarrow 16D$
